Universes of Discourse

Updated: 6 October 2020 @ 2:23 PM

A comparison between our Universes of Discourse (UoD) and the one that is as needed to 'now if (our approach would be an improvement on mine (own or if I could decipher what (our approach is capable of). An approach is one (as good as the deliverables its practitioners produce).

So this end I decided to compare our UoD and the models that we use in order to gain a better insight into (our) aims.

I care what (you do), not in the system itself. I have at least satisfied myself that (ours will) need a lot more work if (you are to even try to convince other practitioners (especially) (O - A. as the Open Group) the minds of / SOs around the world).

The UoD

	Ours	Mine
1st basis	2nd - ec / no / o / (	/ conceptual / 40% / ica / P / (sica)
2nd basis	Abstraction (2nd) and / ar / es / ic / mond / enderson	Platonic / Gea / ism from 2nd / ocrates / bac / ed / up / b / (8mm) / ant
3rd basis	c1:;:	c3:;1 / < c1:;:
1st level	2nd	/ conceptual
2nd level	ec / nica	40% / ica
3rd level	-	P / (sica)
Diagrammatic		

1 (comparison) (our approach to mine) found a few similarities & however not enough to prove that (our approach will) actually (work) under the 3 domains that I developed mine.

On diagnosis (our collaboration mode) I found a number of similarities between our:

- 1# Meta mode)
- 2# / collaborative mode)
- 3# Objectives mode)
- ?# Business mode)

\$ choose model in 1; ; 0 whereas \$ am not sure when (ou choose (ours# 7 however because (ou choose to follow the 1; / entur(developers of the Socio-technical paradigm whereas \$ choose a 1 / philosophical paradigm and (errors that the developer failed to correct left it up to the experience and research of (ou and m(see) It is m(firm opinion that 2ma)) and 7enderson not their meta model) more wrong than did Plato and therein lies the cause of the problem#

Using the information \$ have now gathered from (our web site \$ have managed to come up with the following more detailed comparison#

Meta model:

*is is the best (eve) model which shows the structure of (our approach# It shows the separation between the Socia) Model) and the technical Model)# A separation as far as \$ can see is the root cause of the problem#

*the problems as \$ see them must to name 3":

- 1" Redundancies < conflicts: / caused by the / concepts spread over the 2 universes and 3 domains (Socia) 1 business and 2 service
- 2" isoint: / caused by the information gathered in the . acts in the Data Model component" and the database designs in the deployment component# these may never be resolved
- 3" / conflict between the 2 stems in the deployment component" and the strategies in the 2 service component"

Collaborative model

*this model is designed to illustrate the deliverables that each model is purported to produce. It is decided to overlay these with the deliverables that each approach produces.

/ concepts spread out w/ which could cause redundancies and possible conflicts

Objectives Meta model

*is model is purported to describe how (our approach) in the delivery of the components of the Objectives to other components. In short it is an attempt to show the breakdown of the components of the approach. *the blue rectangles map the to the approach. *there are a number of missing components.

Business meta model

*the remainder of the objects try to represent the mapping of what it would call the
'nowed' objects to the objects

*the blue rectangles map to the approach. These represent a number of fundamental
and secondary entities but they are not aligned as it would have expected them to be or
how it manages them. For example (you do not) in an Offer to a Service and (you
are missing the Product

Full mapping with my approach

Using the deliverables and steps that follow was now able to show a detailed mapping between our approach. Perhaps this is where the major differences begin to show.

Domain	UoD	Socio-Technical Deliverable	State	Ripose Step	Ripose deliverable (focuses on)	State
Business	Socio-Technical	Social Model Business model Service Model Business Model	Implicit	1	Information	Implicit
				1.1	Concepts	
				1.1.1	Objectives	
				1.1.1.1	Goals	
				1.1.1.1.1	Purpose statement	Explicit
				1.1.1.1.2	Benefits	
				1.1.1.1.3	Values	
				1.1.1.1.4	SWOT	
				1.1.1.2	Measures	Implicit
				1.1.1.2.1	Key performance indicators (KPIs)	Explicit
				1.1.1.2.2	Performance indicators	
				1.1.2	Knowledge - industry specific	Implicit
				1.1.3	Actions - Strategies	
				1.1.3.1	Systems - Tactics	Explicit
				1.1.3.2	Sub-systems Industry dependent	Implicit
Technology		Data Model Infrastructure Application Model Deployment & Infrastructure		1.2	Logic	Implicit
				1.2.1	Facts	
				1.2.1.1	Data	Explicit
				1.2.1.2	Logical data model	
				1.2.1.3	Projects	
				1.2.2	Applications	Implicit
				1.3	Physical – platform dependent	
				1.3.1	Database definitions	
				1.3.2	Programs	Explicit

Mapping with yours and TOGAF

As I am able to carry out the comparison between my approach and another, I decided to show you the mapping of our approach and TOGAF. This shows me that both approaches have missing components or deliverables that are (yet to be explicitly) defined.

Domain	UoD	Socio-Technical Deliverable	State	Step		TOGAF deliverables	State
Business	Socio-Technical	Social Model Business model Service Model Business Model	Implicit	H	Change management	Too many	Implicit
					Preliminary	Too many	
				A	Architecture vision	Catalogues	
				B	Business architecture	Matrices Diagrams	
				C	Information systems architecture	Process flow diagrams	
				G	Implementation governance		
Technology		Data Model Infrastructure Application Model Deployment & Infrastructure		D	Technology architecture	Manually created models	
				E	Opportunities & solutions	Use case diagrams	
				F	Migration planning	New systems	

Conclusion

You seem to be on the right path but (our selection of the Socio-technical Uo has constrained (our thinking in% and hence) led (you to the conclusions (you now propose others follow#

As I mentioned it matters not to me what (you do with this information as I now 'now more about (our approach so I can on)(sit back' and watch an(ensuing argument between (you and an(of the other - generation D and - generation O developers with (in' that a) 1 ab(1000 developers are) users#
